

Earlier quote evidence changes the Bayesian decision

Identical last 8 observations, inventory -2, and time 24/64; the entire outcome sequence matches, but earlier quotes differ.

History A: higher informedness History B: lower informedness

Score = expected profit minus incremental inventory cost. Supported example from 12,000 searched candidates.

Constructed histories do not establish frequent occurrence or learned inference.

Joint posterior dependencies also differ, so this comparison does not isolate the causal effect of informedness.
